Term descriptions

- Automatically grabs information the selected terms and examples from the Darwin Core standard

The screenshot shows a spreadsheet interface with a grid. A yellow tooltip box is overlaid on the cell containing the text 'footprintWKT'. The tooltip contains the following text:

RECOMMENDED

A Well-Known Text (WKT) representation of the shape (footprint, geometry) that defines the Location. A Location may have both a point-radius representation (see decimalLatitude) and a footprint representation, and they may differ from each other.

Example: the one-degree bounding box with opposite corners at (longitude=10, latitude=20) and (longitude=11, latitude=21) would be expressed in well-known text as POLYGON ((10 20, 11 20, 11 21, 10 21, 10 20))

The spreadsheet grid shows columns labeled J, K, L, and M. The row containing the tooltip has the text 'footprintWKT' in column J, 'dec' in column K, and 'referencedP subge' in column M.

Future

- Generate a metadata sheet and a «README» sheet
- Use localized term names?
- Support other types of occurrenceIDs
- Event core, extensions, terms outside Darwin Core...
